

An economist's perspective on degrowth

Mikael Malmaeus
2019-01-18

The neoclassical production function

$$\text{GDP} = A \times \underbrace{K^\alpha \times L^{1-\alpha}}_{\text{Resources}}$$

(Solow-Swan)

A = Technology

K = Real capital

L = Labor

Environmental concerns

The "environmental Kuznets curve"

Simon Kuznets

1901 – 1985

Relationship of affluence to various environmental impacts

Population without safe water

Urban concentrations of sulphur dioxide

Urban population without adequate sanitation

Municipal wastes per capita

Urban concentrations of particulate matter

Carbon dioxide emissions per capita

Environmental indices 2017

Environmental Performance Index (EPI)

1. Switzerland (87,7)
2. Luxembourg (83,3)
3. Australia (82,4,1)
4. Singapore (81,8)
5. Czech republic (81,5)
6. Germany (80,5)

9. Sweden (78,1)

Indicators: Environmental health, Air pollution, Water resources, Biodiversity and habitat, Productive Natural Resources, Climate change

Ecological Footprint (WWF) [ha]

1. Luxembourg (15,8)
2. Aruba (11,9)
3. Qatar (10,8)
4. Australia (9,3)
5. USA (8,2)
6. Canada (8,2)

15. Sweden (7,3)

Indicators: Agriculture, forestry, carbon dioxide, fishing, grazing, settlement

Eco-modernism vs. Scientific economics

What is (GDP) growth?

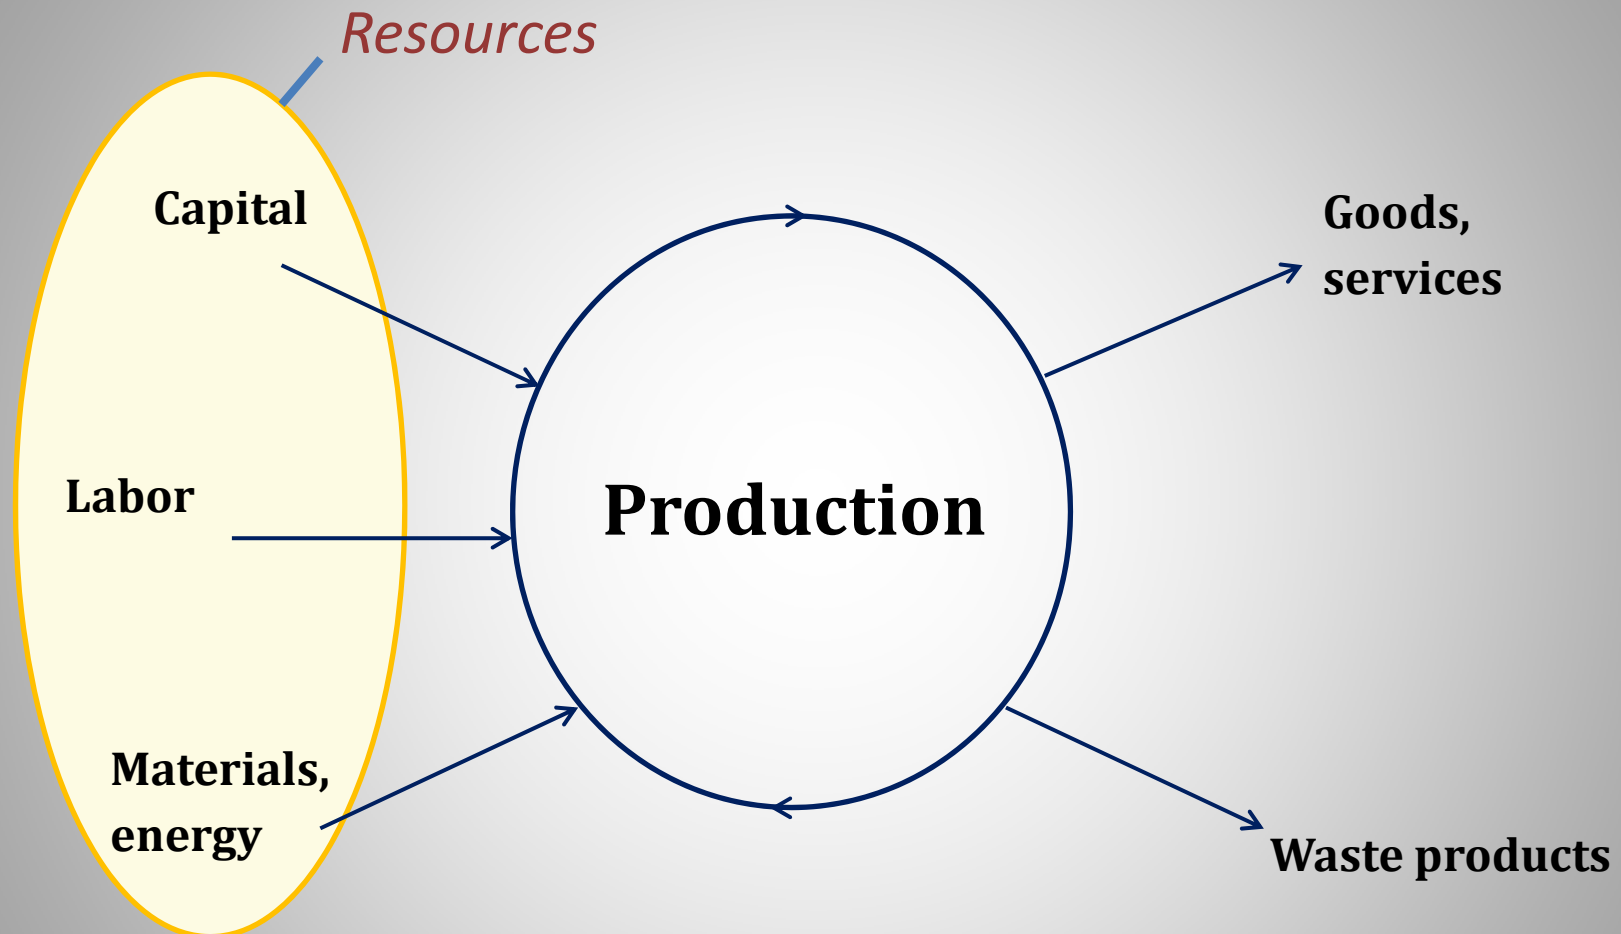

Activity or

welfare

The process of production

Classical economists

Adam Smith
1723-1790

David Ricardo
1772-1823

Karl Marx
1818-1883

Neoclassical economists

William Stanley Jevons
1835-1882

Léon Walras
1834-1910

Alfred Marshall
1842-1924

Economic theories

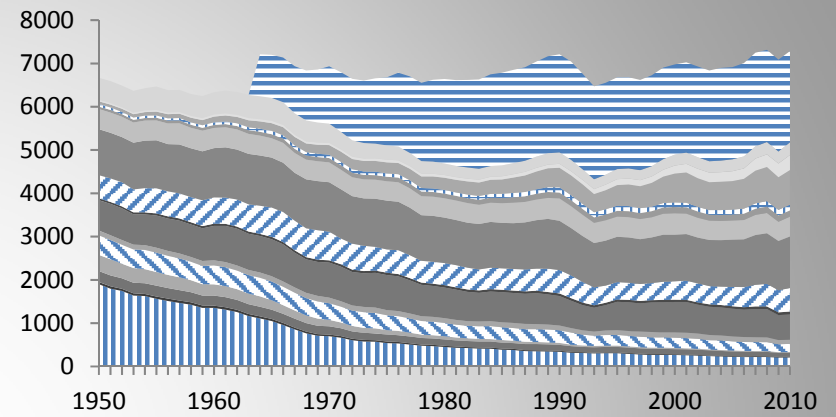

- Classical economics – focus on macro and input
- Neoclassical economics – focus on micro and output

Sweden 1950-2010

Production (GDP):

Labor:

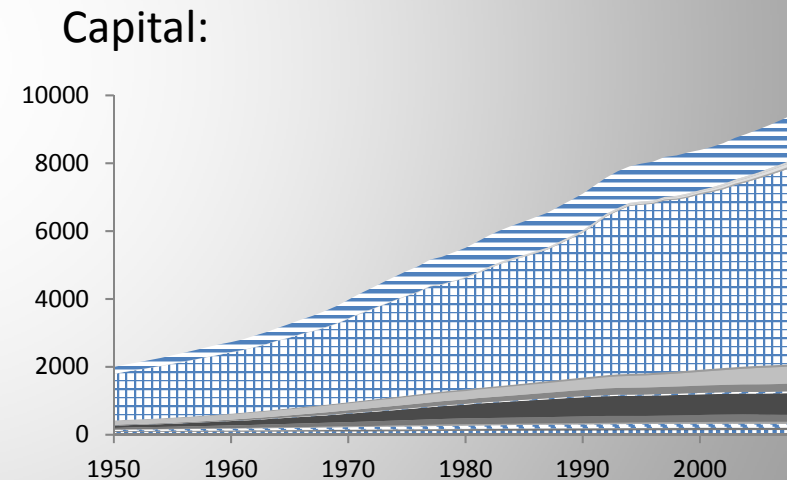

Capital:

Capital: 1 million invested Euros uses ...

- 350 tonnes of CO2 emissions
- 1700 MWh energy
- 50 tonnes of iron
- 2 tonnes of aluminum
- 1400 tonnes of gravel and sand
- 170 tonnes of timber

The neoclassical production function

$$\text{GDP} = A \times K^{\alpha} \times L^{1-\alpha}$$

- Micro economic relationship
- Based on physical assumptions

€500

€1000

Diminishing returns to scale

The neoclassical production function

$$\text{GDP} = A \times K^{\alpha} \times L^{1-\alpha}$$

(Solow-Swan)

A = Technology

K = Real capital

L = Labor

Diminishing returns to scale,
based on microeconomic
principles

Arbete:

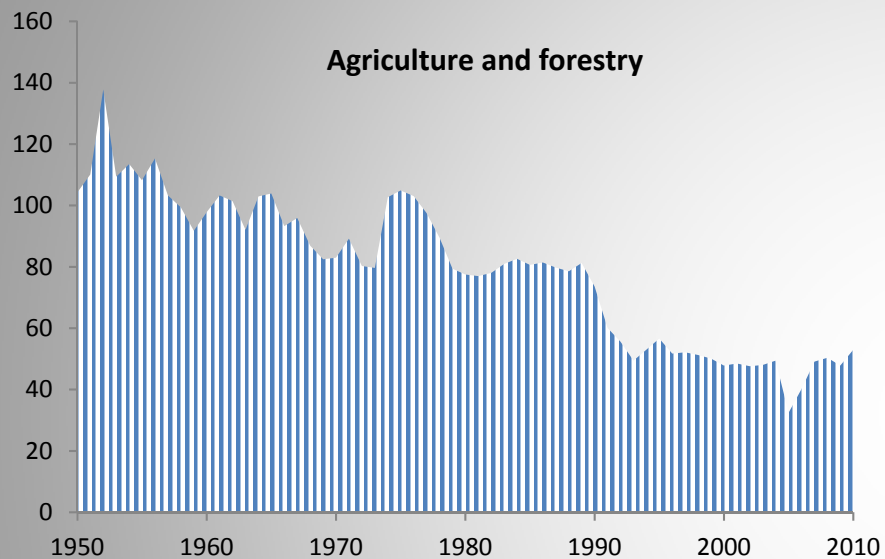

Produktion (BNP):

Kapital:

Capital intensive production

Labor intensive production

Public sector, worked hours

The disappointments of GDP growth

- Material growth: No real **decoupling** between growth and environmental impacts
- Growth in goods, not in services – hidden by relative price changes
- 100% growth in 30 years – what did we get?
 - More unemployment
 - Dismanteling of welfare
 - ***This is where real decoupling occurs!***

The disappointments of GDP growth

But perhaps the problem is not that we *want* growth ...

... but that we *need* growth?

No real experience of low or no economic growth

Sweden's GDP 1800-2000

Economic effects of unmanaged low or no economic growth in the short and long term

	Short term	Long term
Government finances	Negative impact	Potentially balanced
Labor employment	Negative impact	Potentially balanced
Poverty	Negative impact	Potential effects
Inequality	Unclear impact	Potential effects
Indebtedness	Negative impact	Potentially balanced
Financial sector	Negative impact	Adaptions required
Businesses	Negative impact	Adaptions required
Globalization and trade	Negative impact	Adaptions required

Malmaeus & Alfredsson
(Ecological Economics 134, 2017)

Economic effects of unmanaged low or no economic growth in the short and long term

- Short term effects mostly linked to failed expectations and lock-in situations
- Long term effects strongly affected by political prioritizations
- Short term effects trigger pro-growth policy (long term)

Malmaeus & Alfredsson
(Ecological Economics 134, 2017)

Economic effects of unmanaged low or no economic growth in the short and long term

- Much more could be said about interactions and feedbacks ...
- ... between different parts of the economy and between the economy and society as a whole ...
- ... but the key message is that *expectations are very influential on the outcome!*

-> The importance of alternative scenarios

Scenarios for sustainable building and planning

Environmental and social operating space

The built environment

Everyday practices

Sustainability assessment

Studies of the premise for growth or non-growth, consequences, policy responses & distributional effects

Exploring the premise for reaching (mainly climate) goals – what would it mean?

Explore what would happen if growth was no longer a given

Explore strategies for creating a sustainable future not based on growth

Time and social security

Empirical studies exploring perspectives on growth/degrowth & alternative scenarios

Empirical studies exploring current tendencies or examples illustrating certain strategies

Economic modelling

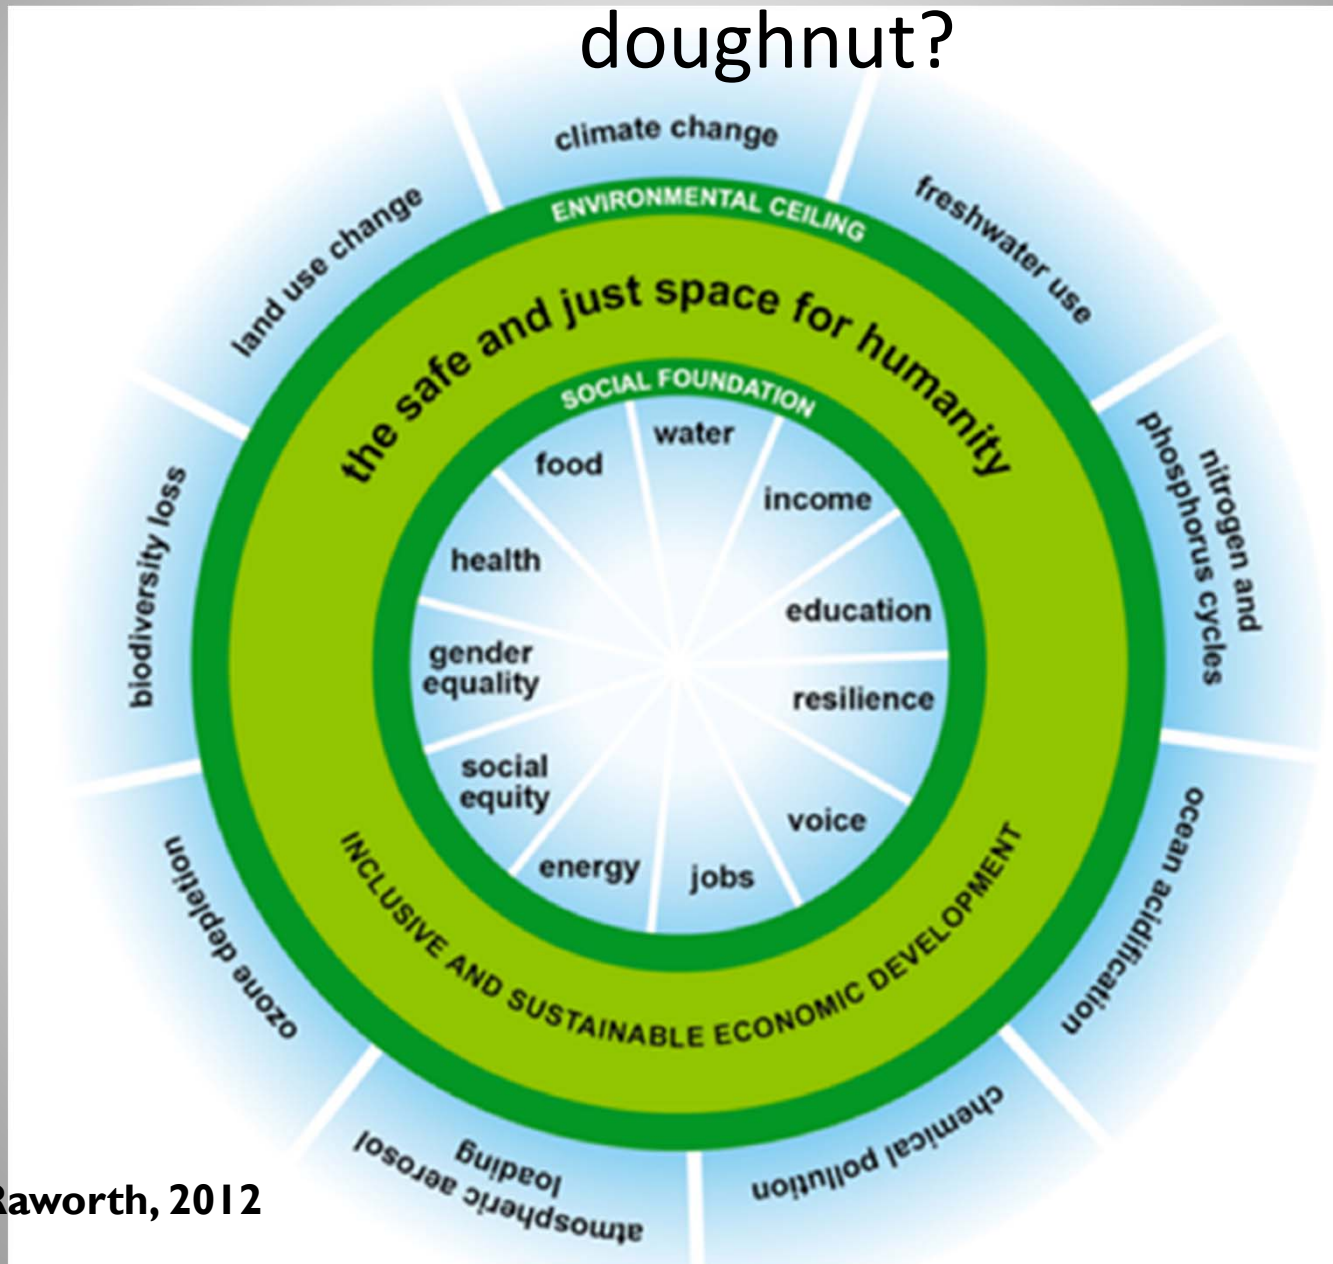

Mobility

Policy and planning

Agriculture

A safe and just space within the doughnut?

Raworth, 2012

Climate

- Zero net emissions of CO₂ in production
- Max 0.82 ton CO₂ eq per capita for Swedish consumption

Distribution of power

- All residents, regardless of, for example, gender, gender expression, sexual orientation, ethnicity and religious affiliation, age, disability, class and income level, should be entitled to participation and influence in political choices and decision making that affect their lives.

Land use

- Per capita land use for final consumption does not exceed global biocapacity = 50% decrease compared to 2015 (max 1,24 global hectares per person).

Resource security

- Residents in Sweden should have sufficient access to resources and services that can create opportunities for housing, education, social care and social security, as well as favorable conditions for good health.
- Distribution of the same resources and services should be done according to fairness principles.

Fauré, Svenfelt, Finnveden, Hornborg (2016)

Four backcasting scenarios 2050:

Total emissions per capita (excl. international travel)

Focus groups in three Swedish municipalities

550 km²
40,000 inhabitants
2 focus groups with 6
+ 6 participants

330 km²
350,000 inhabitants
2 focus groups with 6
+ 9 participants

2490 km²
5,000 inhabitants
2 focus groups with 4
+ 5 participants

Focus question: If Sweden has developed in this way, what would it be like in this municipality? What would the consequences be?

Change expectations!

- Opening up for lower expectations of growth (or non-growth) prevents many negative effects of lower economic growth that generally comes from failed expectations.
- Changed expectations and perceptions of what society and life can look like (through i.e. scenario-based discussions and societal debate) is key for both deciding direction and spurring change
- Living experiences – use the living testbeds out there for testing out alternative practices, systems and ways of life.
